

AP Calculus AB 4-1,4-2, 4-6 Quiz Review #1

Key

Calculators permitted.

1. Find the sum:

$$\sum_{i=2}^4 [(i+1)^2 - (2-i)^3] = (\underline{2+1})^2 - (\underline{2-2})^3 + (\underline{3+1})^2 - (\underline{2-3})^3 + (\underline{4+1})^2 - (\underline{2-4})^3 \\ = 9 - 0 + 16 - (-1) + 25 - (-8) = \boxed{59}$$

2. Use Sigma notation to write the sum: $\frac{2}{\sqrt[3]{5-2}} + \frac{4}{\sqrt[3]{5-4}} + \frac{6}{\sqrt[3]{5-6}} + \frac{8}{\sqrt[3]{5-8}}$

$$\sum_{i=1}^4 \frac{2i}{\sqrt[3]{5-2i}}$$

3. Use 3 middle rectangles to approximate the area of the region bounded by $f(x) = x^2 + 3$, the x-axis, $x = 1$, and $x = 6$.

$$\text{Width} = \frac{b-a}{n} \rightarrow \frac{6-1}{3} = \frac{5}{3} \quad \left| \begin{array}{l} \text{Area} = \frac{5}{3} \cdot f(1\frac{1}{6}) + \frac{5}{3} f(2\frac{1}{6}) + \frac{5}{3} (f(3\frac{1}{6})) \\ = \frac{5}{3} \cdot \left[\left(\frac{11}{6}\right)^2 + 3\right] + \frac{5}{3} \left[\left(\frac{21}{6}\right)^2 + 3\right] + \frac{5}{3} \left[\left(\frac{31}{6}\right)^2 + 3\right] \\ = \frac{5}{3}(6.364) + \frac{5}{3}(15.25) + \frac{5}{3}(29.69) = \boxed{85.509} \end{array} \right.$$

4. Use the table of values on the right to estimate the below:

x	0	4	6	7	10
$f(x)$	5	3	2	3	5

- a. Use 3 left-handed rectangles with intervals indicated by the table to estimate the area between the curve and x-axis on $[0, 7]$

$$\begin{array}{c|ccccc}
x & \overbrace{0} & \overbrace{4} & \overbrace{6} & \overbrace{7} \\
\hline
f(x) & 5 & 3 & 2 & 3
\end{array} \quad \left| \begin{array}{l} \text{Area} = 4 \cdot f(0) + 2f(4) + 1 \cdot f(6) \\ = 4(5) + 2(3) + 1(2) \\ = 20 + 6 + 2 = \boxed{28} \end{array} \right.$$

- b. Use 2 middle rectangles with intervals indicated by the table to estimate the area between the curve and x-axis on $[0, 10]$

$$\begin{array}{c|ccccc}
x & \overbrace{6} & \overbrace{4} & & & 10 \\
\hline
f(x) & 5 & 3 & 2 & 3 & 5
\end{array} \quad \left| \begin{array}{l} \text{Area} = 6 \cdot f(4) + 4 \cdot f(7) \\ = 6(3) + 4(3) \\ = \boxed{30} \end{array} \right.$$

- c. Use 3 right-handed rectangles with intervals indicated by the table to estimate area between the curve and x-axis on $[4, 10]$

$$\begin{array}{c|ccccc}
x & 4 & \overbrace{6} & \overbrace{7} & 10 \\
\hline
f(x) & 3 & 2 & 3 & 5
\end{array}$$

$$\text{Area} = 2 \cdot f(6) + 1 \cdot f(7) + 3 \cdot f(10)$$

$$= 2(2) + 1(3) + 3(5) = \boxed{22}$$

- d. Use 3 trapezoids with interval indicated by the table to estimate area between the curve and x-axis on $[0, 7]$

$$\begin{array}{c|ccccc}
x & \overbrace{4} & \overbrace{2} & \overbrace{1} & & \\
\hline
f(x) & 5 & 3 & 2 & 3
\end{array} \quad \left| \begin{array}{l} * \text{Area} = \frac{1}{2} \cdot w \cdot [h_1 + h_2] \\ \text{Area} = \frac{1}{2} \cdot 4 [f(0) + f(4)] + \frac{1}{2}(2)[f(4) + f(6)] + \frac{1}{2}(1)[f(6) + f(7)] \\ A = 2(5+3) + 1(3+2) + \frac{1}{2}(2+3) \\ A = 23.5 \end{array} \right.$$

$$\text{Area} = \frac{1}{2} \cdot 4 [f(0) + f(4)] + \frac{1}{2}(2)[f(4) + f(6)] + \frac{1}{2}(1)[f(6) + f(7)]$$

$$A = 2(5+3) + 1(3+2) + \frac{1}{2}(2+3) \\ A = 23.5$$

5. Given the region bounded by $g(x) = 6 - x^2$, the x -axis, $x = -1$, and $x = 2$. Use the limit definition to find the exact area of the region.

$$W = \frac{2 - (-1)}{n} = \frac{3}{n}$$

$$A = \lim_{n \rightarrow \infty} \sum_{i=1}^n \text{width} \cdot f(a + \text{width} \cdot i)$$

$$= \frac{15}{n} \left[\sum_{i=1}^n 1 + \frac{18}{n^2} \sum_{i=1}^n i - \frac{27}{n^3} \sum_{i=1}^n i^2 \right]$$

$$A = \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{3}{n} \cdot f\left(-1 + \frac{3}{n}i\right)$$

$$= \frac{3}{n} \left[6 - \left(1 - \frac{6i}{n} + \frac{9i^2}{n^2} \right) \right] \lim_{n \rightarrow \infty} \frac{15}{n} (n) + \frac{18}{n^2} \cdot \frac{n(n+1)}{2} - \frac{27}{n^3} \frac{n(n+1)(2n+1)}{6}$$

$$A = \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{3}{n} \left[6 - \left(-1 + \frac{3}{n}i \right)^2 \right]$$

$$= \frac{3}{n} \left[5 + \frac{6i}{n} - \frac{9i^2}{n^2} \right] \lim_{n \rightarrow \infty} \frac{15n}{n} + \frac{18n^2}{2n^2} - \frac{54n^3 + \dots}{6n^3}$$

$$A = \frac{3}{n} \left[6 - \left(-1 + \frac{3}{n}i \right) \left(-1 + \frac{3}{n}i \right) \right]$$

$$= \lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{15}{n} + \frac{18i}{n^2} - \frac{27i^2}{n^3} \quad 15 + 9 - 9 = \boxed{15}$$

Find the most general antiderivative of $h(x)$. (Find $\int h(x) dx$)

$$6. h(x) = 5x^4 - \pi + \frac{1}{2\sqrt{x}} + \frac{1}{3x^3}$$

$$\int 5x^4 - \pi + \frac{1}{2}x^{-1/2} + \frac{1}{3}x^{-3} dx$$

$$= \frac{5x^5}{5} - \pi x + \frac{1}{2} \cdot \frac{x^{1/2}}{1/2} + \frac{1}{3} \cdot \frac{x^{-2}}{-2} + C$$

$$= x^5 - \pi x + x^{1/2} - \frac{1}{6x^2} + C$$

$$7. h(x) = -2\cos x + 5\sin x - 5\csc x \cot x$$

$$\int -2\cos x + 5\sin x - 5\csc x \cot x dx$$

$$= -2\sin x - 5\cos x + 5\csc x + C$$

8. Find the most general expression of $f(x)$ if $f''(x) = 4x^3 - 5x^2 + 3x - 6$.

$$f'(x) = \int 4x^3 - 5x^2 + 3x - 6 dx$$

$$f(x) = \int x^4 - \frac{5}{3}x^3 + \frac{3}{2}x^2 - 6x + C dx$$

$$f'(x) = \frac{4x^4}{4} - \frac{5x^3}{3} + \frac{3x^2}{2} - 6x + C$$

$$f(x) = \frac{x^5}{5} - \frac{5}{3} \cdot \frac{x^4}{4} + \frac{3}{2} \cdot \frac{x^3}{3} - \frac{6x^2}{2} + Cx + k$$

$$f'(x) = x^4 - \frac{5}{3}x^3 + \frac{3}{2}x^2 - 6x + C$$

$$f(x) = \frac{1}{5}x^5 - \frac{5x^4}{12} + \frac{1}{2}x^3 - 3x^2 + Cx + k$$

9. Find the specific expression of $f(x)$ if $f(x) = \int g(x) dx$, $g(x) = 3x^2 - 4x$, and $f(-1) = 2$

$$\int 3x^2 - 4x dx$$

$$f(x) = \frac{3x^3}{3} - \frac{4x^2}{2} + C$$

plug in $(-1, 2)$
to solve
for C

$$2 = (-1)^3 - 2(-1)^2 + C$$

$$2 = -1 - 2 + C$$

$$2 = -3 + C$$

$$\underline{\underline{5 = C}}$$

$$f(x) = x^3 - 2x^2 + 5$$
