

Circles

A circle can be named by its center using the \odot symbol. A circle with a center labeled C would be named $\odot C$. An unbroken part of a circle is called an **arc**.

2 Types of arcs:

1. A **minor arc** of a circle is an arc that is shorter than half the circle and named by its endpoints.
2. A **major arc** of a circle is an arc that is longer than half the circle and named by its endpoints and one other point on the arc.

Central Angle :

An Angle whose vertex is at the center of the circle

$\angle APB$ is a Central Angle

Semicircle: An Arc that equals 180°

To name: use 3 letters

\widehat{EDF}

THINGS TO KNOW AND REMEMBER ALWAYS

A circle has 360 degrees

A semicircle has 180 degrees

Vertical Angles are Equal

$$\angle A \cong \angle C$$

$$\angle B \cong \angle D$$

measure of an arc = measure of central angle

$\angle EQA$ is a central angle.

$\angle EQA$ is $??^\circ$

$$m \widehat{AB} = \underline{\hspace{2cm}}$$

$$m \widehat{ACB} = \underline{\hspace{2cm}}$$

$$m \widehat{AE} = \underline{\hspace{2cm}}$$

Arc Addition Postulate

Arc Addition Postulate: The measure of an arc formed by two adjacent arcs is the sum of the measures of the two arcs.

$$m \widehat{ABC} = m \widehat{AB} + m \widehat{BC}$$

Tell me the measure of the following arcs.

$$m \widehat{DAB} =$$

$$m \widehat{BCA} =$$

$$\angle A \cong \angle C$$

$$\angle B \cong \angle D$$

measure of an arc = measure of central angle

$\angle EQA$ is a central angle.

$\angle EQA$ is $??^\circ$

$$\begin{aligned} m \widehat{AB} &= 96^\circ \\ m \widehat{ACB} &= 264^\circ \\ m \widehat{AE} &= 84^\circ \end{aligned}$$

Arc Addition Postulate

Arc Addition Postulate: The measure of an arc formed by two adjacent arcs is the sum of the measures of the two arcs.

$$m \widehat{ABC} = m \widehat{AB} + m \widehat{BC}$$

Tell me the measure of the following arcs.

$$m \widehat{DAB} = 240^\circ$$

$$m \widehat{BCA} = 260^\circ$$
